

Hello, nice to meet you!

I am **Adrián**, a Spanish computer engineer, and I also hold a Master's Degree in Project Management. I have a work experience of over 15 years, where 4 of them were working in the development studio I co-founded and lead, and others have spread over technical and management positions - in different business verticals but always tech-related. Leadership has been involved in all my positions - in one way or another.

Before moving to Denmark, I have been living for 6 years in The Netherlands (Amsterdam), and I have worked in multicultural environments since then.

Who am I, you might wonder? I'm a very easy going, sociable, fast-learner, curious and natural leader. I do what I love, and I love what I do. I lead by example and work side by side with my teams.

My profile is a hybrid of **technical and managerial experience**, but always related to technological projects. I bring business and product vision to tech teams, partly thanks to having started and developed a company. I am a fast learner, curious to see how technology can improve the users experience in multiple areas. I have a strong motivation, drive, and sense of responsibility with myself, my team and clients (or peers), and people like my positive and easy going, can-do attitude.

My day to day tasks have included the whole variety of duties that are related to software development projects: from the concept definition to the technical analysis, to the architecture definition of the systems, to the execution of the designs by programming, and further testing and quality assurance, and optimization of the software product via monitoring of KPIs and user behaviors. In the end, anything that entails **delivering useful software**.

I am a strong believer in agile principles to deliver value in the engineering work: developers collaborating with stakeholders, delivering software as early as possible, and a constant feedback loop to improve the products.

On the technical side, I'm a "*specialized generalist*", always working between different expertises, such as mobile and web development, devops, team leading... This has involved a variety of languages and frameworks in the web-side, both in the backend - with Drupal, Wordpress, Symfony or Zend), Java/J2EE and serverless architectures (with node.js) - and in the frontend - from the concept prototype to the implementation of the design with responsive CSS frameworks (Foundation, Bootstrap, Material Design), and usage of JS frameworks (such as AngularJS, Phonegap).

In the mobile field I have extensive experience with both native Android and iOS SDKs and platforms, with many published apps. I also have experience with hybrid frameworks like Phonegap or Titanium Appcelerator.

I hope this information encourages you to talk with me, and hear back from you soon!

Adrián Moreno Peña
